Learning Java 9: Databases and Multithreading in Java

User Assignment-3

Problem Statement:

- Create a json file called customers.json, with fields custId, custName, city and pin and populate with some data.
- Write a hibernate program to read the json data from the json file and store it in the Postgre mysql database.
- To access the postgre mysql, create a docker image with postgre mysql and run it to perform the database operations.
- 4. In the same program read the data which is inserted in the above from the postgre mysql and display on the console.

```
customers.json
                                                             JSONProcessor.java
